
EE 529: Embedded Systems

Course Code	EE 529
Course Name	Embedded Systems
L-T-P-C	3-0-2-4
Prerequisites	IC161 - Applied Electronics, CS201 Computer Organization or any course on microprocessors or Equivalent
Intended for	BTech Computer Science Engineering (CSE) and Electrical Engineering (EE), MS, M. Tech. & PhD.
Distribution	Elective for Third and Final year B. Tech (CSE/EE), MS, M. Tech. in VLSI/Signal Processing and Communication/Power Electronics and Drives & PhD
Approval	18th BoA (Sep 2017); 14th Senate (Oct 2017)

Course Contents

- **Introduction to embedded systems:** Understanding an embedded system, design metrics, design challenges, technologies for embedded systems. [2 Lectures]
- **Custom Single Purpose Processor for Embedded Systems:** Design of data-paths and controllers, finite state machines, custom single purpose processor design at RT level, optimizing custom single purpose processors. [3 Lectures]
- **Hardware Description Language:** Introduction to hardware description language, overview of structural, behavioral and dataflow modeling of digital systems using hardware description language, notion of finite state machines, delay modeling, memory modeling, synthesizable & non-synthesizable HDL codes for digital system design. [3 Lectures]
- **Introduction to FPGA:** Introduction to complex digital systems design, notion of programmable logic devices, overview of FPGA architecture, realization of data-path and controller, timing analysis of data-path and controller, synthesis, placement, routing, performance optimization. [3 Lectures]
- **FPGA based systems design:** Implementation of simple systems using FPGA exercising the timing closure paths. [2 Lectures]
- **Physical design automation of embedded systems (from the perspective of custom single purpose processors for embedded systems):** Partitioning, floor-planning, placement, routing; clock design considerations, timing margins, clock skew, clock distribution networks. [3 Lectures]
- **Dynamically reconfigurable Embedded Systems:** Static versus dynamic reconfiguration of embedded systems, full versus partial reconfiguration, voltage scaling and power management issues in dynamic reconfiguration. [3 Lectures]
- **Introduction to Microcontrollers:** Introduction to microcontrollers, overview of architecture of a typical microcontroller such as AVR microcontroller, addressing, assembly language programming. [4 Lectures]
- **Memory interfacing:** Memory technologies SRAM, DRAM and ROM, different types of DRAM architectures 2D RAM, FPMDRAM, EDODRAM, SDRAM, RDRAM, DDRAM, DDR2RAM, etc, different types of ROM- PROM, EPROM, EEPROM, memory interfacing circuits, single cycle versus multiple cycle interfacing, timing diagrams, etc. [3 Lectures]

- **Interfacing with I/O devices:** Port and bus based I/O, Memory mapped and I/O mapped I/O, register and tristate buffer based I/O interfacing, arbitration methods priority, daisy chain and network oriented arbitration methods, serial protocols SPI and I2C. [4 Lectures]
- **Timers and Counters:** Timer/counter programming, notion of watch dog timers and real time clocks. [1 Lectures]
- **Interrupt processing:** Introduction to interrupts, external versus internal interrupts, software versus hardware interrupts, synchronous versus asynchronous interrupts, single interrupt versus multiple interrupt systems, prioritization of interrupts, inversion of interrupt priorities, inheritance of interrupt priorities and associated protocols. [4 Lectures]
- **Real world interfacing of microcontrollers:** Interfacing with simple devices such as LCD, keyboard, motor control, sensors, LED 7 segment display, DTMF decoder, etc. [2 Lectures]
- **Hardware Software Codesign:** Notion of hardware software partitioning, graph based and pareto optimal approaches to hardware software partitioning, resource and timing constrained hardware software partitioning. [3 Lectures]
- **Internet of Things (IoT):** Overview of Internet of Things, IoT architecture, Communication protocols, Notion of internet of everything. [1 Lecture]

Laboratory Modules

Laboratory exercises based on timers and counters, interrupts, serial peripheral interface, integrated circuit, hardware description language based hardware modeling of embedded cores, hybrid embedded processors, FPGA implementation of embedded processor architectures.
