

IC 161: Applied Electronics

Course Code	IC 161
Course Name	Applied Electronics
L-T-P-C	3-0-0-3
Prerequisites	None
Intended for	UG (1st Year)
Distribution	Core
Semester	Even/Odd
Approval	2nd Adhoc Senate (May 2012), in the B.Tech Institute Core (common core courses) curriculum
Revised	64th BoA (May 2026) - syllabus revised

Course Objectives

To understand the principle behind common digital and analog electronics devices. Understanding the fundamentals of electronic components and electrical quantities used in electronic circuits. To analyse basic analog and digital electronic circuits used in engineering applications. To introduce students with the concepts of digital electronics including logic gates, combinational, and sequential circuits.

Course Contents

- **Devices and Basic Circuits:** Ideal Diode, PN-Junction Diodes, Clipping and Clamping, Rectification, Zener diode regulator, MOSFET structure and operation, MOSFET switches, biasing, amplifiers (Common Source, Common Gate, Common Drain). Basic logic design with transistors and diodes (CMOS). (10 hours)
- **Introduction to RLC Circuits and Network Theorems:** Fundamentals (Electrical Quantities, Passive Elements, Ohm's Law, Kirchhoff's Laws, Series and Parallel Circuits), Series and Parallel RLC Circuits, Resonance in RLC Circuits, Resonant Frequency, Q-Factor, Bandwidth, Important Network Theorems (Superposition Theorem, Thevenin's Theorem, Norton's Theorem, Maximum Power Transfer Theorem, Reciprocity Theorem, Millman's Theorem). (6 hours)
- **Feedback and Operational Amplifiers:** Introduction to feedback, Operational amplifiers (as a black box), the golden rules, Basic op-amp circuits: Inverting and Noninverting amplifier, Follower, Integrators, Differentiators, Precision rectifiers, Comparators, Schmitt trigger. (7 hours)
- **Digital Electronics:** Number systems (Binary, Decimal, Hexadecimal, Octal), Binary algebra, De-Morgans laws, Combinational Circuits: Adder, Subtractor, Decoder, Encoder, Multiplexers, Demultiplexers Sequential Circuits: Latch, Flipflops, Counters, Shift registers, and Memory. (10 hours)
- **Measurement Transducers:** Temperature, light, acceleration, pressure, force, velocity, magnetic field, particle detectors. (4 hours)
- **Microcontrollers:** Application of Microcontrollers, General Architecture, Interfacing, Bus Signals, Interrupts, Registers, Support Chips. Case study: Compare the architectures of two popularly used microcontrollers, programming of a microcontroller with examples. (5 hours)
