

ME 612 Introduction to Bio-materials

Course Number : ME 612

Course Name: Introduction to Bio-materials

Credits : 3-0-0-3

Prerequisites :

Intended for : B.'Tech., M. Tech.,M.S.,and Ph. D.

Distribution:

Approval: 8th Senate; OTA

Objective:

Developing materials for use in medicine is a challenging interdisciplinary process and requires an understanding of material bulk and surface properties, the various biological responses to the materials, the clinical context of their use, manufacturing processes, cost, sterilization, packaging and regulatory issues. This course is designed to introduce students to the various classes of biomaterials'In use and their application In selected subspecialties of medicine.

Upon successful completion of this course, the student will be able to:

1. Differentiate the various classes of biomaterials on the basis of structure and function;
2. Differentiate various analytical methods based on their use to characterize bulk and surface properties of biomaterials
3. Differentiate the molecular and cellular events that follow exposure of materials to bodily fluids and to contact with various tissues of the human body;
4. Differentiate various biomedical devices based upon function, biomaterial composition patientrisk and clinicalapplication; and to
5. Describe various practical aspects of biomedical device design, fabrication and testing.

Course contents

Introduction to basic concepts of Materials Science; Salient properties of important material classes; Property requirement of biomaterials; Concept of biocompatibility; Structure and properties of biological cells & tissues; cell-material interactions and foreign body response; Assessment of biocompatibility of biomaterials, in vitro biochemical assays (cellular adhesion, cellular viability using MTT osteogenic differentiation using ALP assay; Biomnunalisation using Osteocalcin assay);

In vivo testingand histocompatibility assessment; genotoxicity assessment (Physical damage to DNA by biomaterial eluates); important biometallic alloys: Ti-based, stainless steels, Co-Cr—Moalloys; Bioinert, Bioactive and bioresorbable ceramics; Processing and properties of different bioceramic materials with emphasize on hydroxyapatite; synthesis of biocompatible coatingson structural implant materials; plasma spraying of carbon nanotljbe reinforced hydroxyapatite on Ti-6Al-4V substrate;Microstructureand properties of glass-ceramics;biodegradablepolymers; Design concept of developing new materials for bio-implant applications.
